

AI Use Declaration - Lab 01

I used Claude (Anthropic's AI assistant) throughout this lab in the following ways:

- Setup and command-line guidance: I am new to using the command line, so I asked Claude to explain each setup step (creating a virtual environment, installing dependencies, using git) in detail, including troubleshooting errors I encountered along the way (e.g., a failed network connection during git push, a nested folder from a ZIP extraction).
- Interpreting Part 0/1/3 output: After running each script, I asked Claude to help me understand what the printed numbers meant and how they related to the lab's tokenizer concepts.
- Extension tasks (Task 1-3): I asked Claude to help me write parallel EN/RU/KK corpus text and the small standalone script for Task 2, based on the exact specifications in the lab's README. I ran all scripts myself and verified the outputs against the expected ranges given in the README.
- Drafting the final report: I discussed my findings with Claude and asked for help structuring and writing the one-page hand-in report in clear English.

I did not use AI to run the API calls or generate token counts itself. All numeric results in this submission come from my own executed scripts (Part 0, 1, 3, using the reference `measurements.example.json` since I did not have access to the instructor's Part 2 API key). All written analysis and conclusions are in my own words, based on my understanding of the executed output.
